CONTACT SURFACE OF FOOD PACKAGING**

# EuPIA Inventory List – Notes & Lists

## 1. Preliminary note

The EuPIA Guideline on Printing Inks Applied to the Non-Food Contact Surface of Food Packaging Materials and Articles already includes a scheme for the careful selection of raw materials to be used in the manufacture of food packaging inks. Nevertheless, EuPIA had decided additionally to make publicly available a list of all the substances used in the manufacture of food packaging inks, with the aim of implementing a transparent tool for packaging converters and brand owners. At the same time the list is intended to become a reference for competent authorities. Since then, the Swiss Ordinance on Materials and Articles has been amended with provisions specific to food packaging inks. The core element of the new regulation is a list of permitted substances identifying the only substances to be used in the manufacture of food packaging inks marketed in Switzerland.

However, it is the intention of EuPIA to collate and develop its own inventory list, allowing for the most flexible way of providing update information such that the latest status of substances/raw materials used in food packaging inks is represented.

Printing inks and varnishes for food packaging are intended to be applied to a variety of substrates using different printing techniques, such as:

- Rotogravure and flexographic printing on flexible films, Aluminium foil, paper and cardboard
- Offset printing on paper, cardboard, rigid plastics and metal
- Screen printing on rigid plastics, films, foil and metal
- Roller coating on metal
- Digital inks printed on paper, cardboard, flexible films and Aluminium foils
- Jet inks printed on paper, flexible films, Aluminium foils and rigid plastics

Depending on the field of application and their formulation, printing inks and varnishes have different drying mechanisms:

- Evaporation through hot air drying for water and solvent based systems
- Penetration into substrate structures with or without oxidative polymerisation
- Radical or cationic polymerisation induced by UV or EB irradiation.
- High temperature drying by solvents evaporation and/or polymerisation using baking ovens.

In the light of these diversified application requirements the strong chemical distinctions between ink systems and their constituent parts must be stressed. It should also be noted that the composition of the dried applied ink in almost all cases is not identical to the delivered 'wet' form. Furthermore it should also be noted that end-user and/or customer requirements may prevent the use of some of the materials below in certain applications.

## 2. Constituent parts of the Inventory List

The Inventory List comprises of seven raw material groups used in the manufacture of food packaging inks and in addition a list of monomers and other precursors permitted to be used in the manufacture of plastic materials and articles in contact with food.

The list of additives permitted to be used in the manufacture of plastic materials and articles in compliance with the legal constraints is included:

- Additives
  - chemical categories
  - ingredient substances
- Colorants, (i.e. pigments, dyes)
- Pigment additives
- Polymeric resins
  - generic groups
  - monomers/precursors/raw materials

- Solvents

- Photo-initiators
- List of monomers and other precursors permitted to be used in the manufacture of plastic materials and articles in contact with food, including additives permitted to be used in the manufacture of plastic materials and articles in contact with food.

### **3. Additional remarks**

- 3.1 Polymeric substances are described by their monomers and precursors.
- 3.2 Polymerisation aids like catalysts and starters are not in the scope of the inventory list.
- 3.3 Pigment preparations are broken back into their ingredients such as colorants, solvents, additives, dispersing aids and polymeric substances (their monomers). These substances are included in the respective substance groups.
- 3.4 Additives, which are preparations, are broken back into their ingredients such as e.g.detergents (wetting agents), solvents, waxes, plasticisers, polymeric substances (their monomers). These substances are included in the respective substance group.
- 3.5 Photo-initiators are included in a separate document " EuPIA Suitability List of Photo-initiators for Low Migration UV Printing Inks and Varnishes" (available at [www.eupia.org](http://www.eupia.org))
- 3.6 Substances may be covered by generic names where they have no CAS N° and are covered by a group of substances.

### **4. Additives**

Additives are substances used normally in small quantities, which essentially impart specific technical properties to the printing ink, primer or overprint varnish.

## 5. List of Colourants

All colourants (pigments and dyes) used in the manufacture of packaging inks have to comply with the specifications given in the Council of Europe Resolution AP (89)1 on the use of colorants in plastic materials intended to come into contact with food. Please note, pigments are finely dispersed as solids in to the printing ink binders whilst dyes are dissolved, which is a significant distinction in

terms of method of preparation and properties thereby imparted by either colorant type. It should also be noted that on a quantity basis dyes represent a minor proportion (< 1%) of the overall colorant volumes.

## 6. Polymeric Resins

The polymeric resins are represented by their generic groups. They act as binders in the inks and coatings used on packaging. Binders are the film-forming components of inks and coatings in which the colorants may be finally dispersed or dissolved. Binders are also important for the transfer of the ink from the press to the substrate. After the drying of the print, binders serve to adhere the ink film to the printed surface and contribute to functional properties.

## 6.2 Polymeric Resin - Monomers/Precursors/Raw Materials

The characterisation of resins is further defined by breaking down all generic resin groups into their precursor monomer-units.

Additives used in resins (e.g. stabilizers) are intended to be incorporated at a later stage. This listing will not include polymerisation production aids e.g. starters and catalysts.

## 7. Solvents

Except for some specific offset ink systems, solvents volatilise or evaporate directly after the ink or varnish is applied to the packaging substrate. It is common practice to use solvent combinations in order to control the speed of the drying process. In addition the concentration of residual solvents in the ink or coating being applied is managed to ensure that it is kept to a minimum in the final printed article.

## 8. Energy curing monomers

The drying mechanism used in the application of conventional drying inks and coatings and those designed and formulated for use in energy curing systems is completely different.

In conventional inks and coatings the binders are macromolecules, manufactured separately through the polymerisation of monomers and starting substances; in the case of energy curing systems, the monomers and oligomers are components of the

applied wet ink formulation. In the energy curing system the polymerisation process takes place via irradiated energy during the printing process at the printers' premises.

## 9. Photoinitiators

A Photoinitiator is any substance that initiates a chemical reaction by absorbing a photon to form an excited, reactive state.

Photo-initiators are included in a separate document " EuPIA Suitability List of Photo-initiators for Low Migration UV Printing Inks and Varnishes" (available at [www.eupia.org](http://www.eupia.org))

## 11. Context of the EuPIA Inventory List

This list has been generated through contributions from over 95% of ink suppliers in Europe. These suppliers sell in to the many types of printed food packaging applications, e.g. flexible, can coated, folding carton etc., as such it should be noted that there are chemicals listed that would not be suited, nor permitted for use in all such applications.

### Contact Details:

If you have any questions or enquiries with respect to this Inventory, please send a formal e-mail enquiry to the following address: [eupia@cepe.org](mailto:eupia@cepe.org).

These enquiries will be processed by the relevant experts within the EuPIA organisation and replies sent accordingly.
